Assistant Professor, School of Nursing, Noida International University, UP, India

Abstract: *A teaching method comprises the perceptions of nursing students used for instruction. Commonly used teaching methods may include lecture, demonstration, teaching or combinations of these. The choice of teaching method to be used largely depends on the information or skill that is being taught, and it may also be influenced by the aptitude and enthusiasm of the students. A community health nursing bag technique is a tool where a community health bag is employed, through which the nurse throughout his or her home-visit performs nursing procedures simply. It saves time and effort for home health nurses and provides effective medical care.*

Keywords: Community Health Nursing Bag, Perception, Nursing Students, Utilization

1. Introduction

The community health nursing bag is additionally known as a home health care bag, public health bag, medical bag, visiting bag, and provide bag use by a community health nurse and nursing students to hold the required instrumentality, articles, and provides to supply patient care within the home setting. A community health nursing bag technique is a tool where a community health bag is employed, through which the nurse throughout his or her home-visit performs nursing procedures simply. It saves time and effort for home health nurses and provides effective medical care. A number of the earliest nurses used nurse's luggage. Nightingale treated wounded troopers with a black bag in her hand. The medical bag was a convenient method for the nurse to hold all of her provides and instrumentality to her patient's home. It absolutely was additionally a mechanism to unfold microorganisms from patient to patient. Historically, it absolutely was an oversized black animal skin bag. In the early decades, the nursing bag is and has been thought about as a vital tool for community health nurses. The bag contains the necessary articles and equipment required for a home visit and to supply patient care on the idea of the initial assessment. It additionally includes the articles that are used for the assessment of AN sudden scenario that arises within the home setting. The bag offers immediate access to infection management provides like those required for hand laundry and barrier protection. Throughout its history, the nurse was recognized within the community as a health care supplier with the assistance of the community health bag.

2. Need of the Study

The aim of the study is to know whether nursing bags support supply treatment in patients' homes Scientists have known to have been compelled to develop a new style of nursing bag for twenty-one centuries 2 varieties of knowledge were collected in the previous review of the literature and empirical knowledge. The services are evaluated, and it shows that this bag isn't ready to face the challenges of health care staff practiced within the home atmosphere. AN analysis shows variation in bag sort, design, weight, and material used. The bag mustn't weigh

additional than two to five weight units, and it ought to be created of absorbent that prevents infections and bacterium.

3. Objectives

1. To assess the perceptions of the nursing students towards community health nursing bag and its utilization.
2. To associate the study findings with chosen demographic variables.

4. Methodology

Analysis approach:-Quantitative Descriptive alpha analysis approach Research design:-Quantitative on Experimental Descriptive alpha Research style Setting of the study:-The study was conducted in chosen nursing schools.

Sample:-The sample for the gift study comprised of 150 nursing students Sampling technique:-Non-chance convenient sampling technique was employed in the study to gather subjects.

5. Major Findings

1. Finding related to demographic characteristics of participant 65.3% of the nursing students had age 18-22 years, 31.3% of them had age 23-26 years and 3.3% of them had age 27-30 years. 22% of them were males and 78% of them were females. 33.3% of them were Second year basic B. Sc. Nursing students, 33.3% of them were fourth year basic B. Sc. Nursing students and 33.3% of them were GNM first year and third year students.
2. Finding related to the perceptions of nursing students towards utilization of community health nursing bag Majority 100 (66.7%) of nursing students had good perception (Score 73-96) and 50 (33.3%) of them had average perception (Score 49-72) towards community health nursing bag and its utilization. Analysis of data related to the association of the study findings with selected demographic variables Analysis of data related to association of the perceptions of the nursing students towards utilization of the community health nursing bag findings with selected demographic variables was done

by using Chi-square test. The p-values 0.820 are large (greater than 0.05), this shows that the age of the nursing students do not have significant association with perceptions of the nursing students towards community health nursing bag and its utilization the p-values 0.060 are large (greater than 0.05), this shows that the gender of the nursing students do not have significant association with perceptions of the nursing students towards community health nursing bag and its utilization. The p-values 0.677 are large (greater than 0.05), this shows that the Professional qualification of the nursing students do not have significant association with perceptions of the nursing students towards community health nursing bag and its utilization. Since all the p-values are large (greater than 0.05), none of the demographic variables was found to have significant association with perceptions of the nursing students towards community health nursing bag and its utilization.

6. Discussion

Majority of the 65.3% of the nursing students had age 18-22 years, 31.3% of them had age 23-26 years and 3.3% of them had age 27-30 years. Most of the nursing students 78% of them were females and 22% of them were males and majority of 100 (66.7%) of nursing students had good perception (Score 73-96) and 50 (33.3%) of them had average perception (Score 49-72) towards community health nursing bag and its utilization. All the p-values are large (greater than 0.05), none of the demographic variables was found to have significant association with perceptions of the nursing students towards community health nursing bag and its utilization. So the nursing students should continue to carry community health nursing bag in the home visiting to care for the people during home visiting Proper bag technique should be taught to the nursing students which will facilitate to give proper care to the community people and it will also prevent infection and help in preventing the spoiling of the content of the community health nursing bag Nursing students are the building block of the nursing profession so proper bag technique and proper utilization of the community health bag should be taught to the students so their perception about the utilization of the community health nursing bag will never be in a negative path. it will always good.

7. Conclusion

Majority of 100 (66.7%) of nursing students had good perception (Score 73-96) and 50 (33.3%) of them had average perception (Score 49-72) towards community health nursing bag and its utilization. Since all the p-values are large (greater than 0.05), none of the demographic variables was found to have significant association with perceptions of the nursing students towards community health nursing bag and its utilization.
