Abstract: Land is a free gift of nature with a fixed supply and is the basic asset of an agrarian economy. It is a prerequisite for cultivation, the major source of income, and an index of household status; thus, it is of immense significance to study the distribution patterns of landholdings for better agricultural planning. Landholding size determines investment in agriculture, productivity, farm mechanisation, and the sustainability of farm incomes themselves. "Today, land ownership is considered one of the most important sources of livelihood and social status for farmers, and the land market operates largely through tenancy rather than outright sale or purchase" A lot of research work has been done to study the aftereffects of land reforms, inequality in land distribution, etc. Hence, the present study is an attempt to make a trend and inequality analysis of the size of operational holdings in Karnataka state from 1970-71 to 2015-16, which includes an appreciation of the distributional pattern of operational land holdings and their area, the spatial distribution of the size of holdings and its changes in size distribution, and to suggest appropriate strategies in the light of prevailing government policies and programmes to improve the landholding settings. The district has been considered the smallest unit of study. The present study is mainly based on secondary sources of data, and the required data for the study was obtained from the Directorate, Department of Economic and Statistics, and State Agricultural Census Commissioner, Bengaluru; besides this, data were also collected from various government offices and websites. To achieve the objectives mentioned above, the relevant statistical and cartographic techniques (ArcGIS)along with Microsoft Excel and STATA 12 have been employed. To describe the spatial pattern of variations in the average size of land holdings in the Karnataka state during 2010-11 and 2015-16, all the districts are grouped into four categories: very high, high, medium, and low concentration areas. At last, the results were presented with suitable diagrams and figures.

Keywords: size of land holdings, fragmentation, inequality, Gini coefficient, policies and programmes

1. Introduction

Land is a free gift of nature with a fixed supply and is the basic asset of an agrarian economy. It is a prerequisite for cultivation, the major source of income, and an index of household status; thus, it is of immense significance to study the distribution patterns of landholdings for better agricultural planning. Landholding size determines investment in agriculture, productivity, farm mechanisation, and the sustainability of farm incomes themselves. "Today, land ownership is considered one of the most important sources of livelihood and social status for farmers, and the land market operates largely through tenancy rather than outright sale or purchase" In practise, it is found that in different countries, the standard varies enormously in accordance with the pressure of cultivators on the cultivated area and the law of inheritance. Even granting homogeneous physical conditions, it is clear that the variation in capacity, resources, and ambitions of the farmers will create pressures on farms of corresponding size (J. Singh, 1974, p. 70). A lot of research work has been done to study the aftereffects of land reforms, inequality in land distribution, etc.

A new concept in Indian agriculture has been introduced: a census operation centred around the operational holdings. Such a survey was conducted for the first time in 1970–71. In this state, more than 65 percent of rural workers are engaged in farming, of which more than 48.0 percent are classified as cultivators. In the absence of opportunities for other occupations, sole reliance on land is legitimate, and it causes further subdivisions of land holdings into tiny, scattered plots. Land, like other assets, is inherited as private property, and a father's land is equally divided among his

children, mostly among sons, keeping in view the fertility and location of the land. This unending process is still running, and there is no such thing as a permanent farm. The size of the holding is thus determined by the law of succession and the increasing burden and dependency of the population on land, not by the socio-economic conditions in accordance with the type of farming practised. Thus, the size of the holding is bound to vary spatially and temporally. An attempt has been made to make a trend and inequality analysis of the size of operational holdings in Karnataka state from 1970-71 to 2015-16, which includes an appreciation of the distributional pattern of operational land holdings and their area, the spatial distribution of the size of holdings and its changes in size distribution, and to suggest appropriate strategies in the light of prevailing government policies and programmes to improve the landholding settings.

2. Study Area

Karnataka is one of the developed states of India. It is located in the south-western part of the Indian peninsula and lies between 11^{0 31 1} to 18⁰ 45 ¹ northern latitude and 74⁰ 12 ¹ to 78⁰ 40 ¹ eastern longitude. The state is bounded by Maharashtra and Goa from the north, Tamil Nadu and Kerala from the south, the Arabian Sea from the west, and Andhra Pradesh from the east (Fig. 1). The Karnataka state extends for about 750 km from north to south and about 400 km from east to west. The total land area is 1.91.791 sq. km. It accounts for 5.83% of the total area of the country (32.88 lakh sq. km) and ranks 8th among the major states of India in terms of size. In 2011, the state had 30 districts, 176

Source: Economic Survey Report 2020-2021, published by Directorate of Economics & Statistics, Bengaluru

Karnataka state is divided in ten agro-climatic regions taking into consideration the geographical aspects. The contribution of agriculture sector to the overall GSDP saw an increase from 12.16 percent to 13.15 percent in 2020-21 against 2019-20. The predominance of rural populations makes the state's economy primarily agrarian. More than 65 percent of the state's workforce, however, is still dependent on agriculture and its allied activities for their livelihood. The economic development and prosperity of the masses depend mainly on agriculture. It has witnessed rapid industrialization in the recent past, particularly after the launch of policies of economic liberalisation in the state.

3. Objectives

The present paper comprehensively evaluates the trend and inequality analysis of the size of operational holdings in the

districts of Karnataka State, India. In this context, the study has been undertaken with the following specific objectives:

- To study the distributional pattern of operational land holdings and area inKarnataka State (2015-16).
- To designate the spatial distribution of size of holdings and its changes in size distribution of holdings in the districts of Karnataka State (2010–11 and 2015–16).
- To understand the trend and inequality analysis in the size of land holdings and the operational area in the state and
- To recommend some suitable strategies in light of prevailing government policies and programmes to improve the landholding settings in the state.

4. Database and Methodology

The present study is mainly based on secondary sources of data, and the required data for the study was obtained from the Directorate, Department of Economic and Statistics, and State Agricultural Census Commissioner, Bengaluru; besides this, data were also collected from various government offices and websites. A large number of books, articles, various websites, dissertations, and published and unpublished works from different sources have been used. The district has been considered the smallest unit of study. To achieve the objectives mentioned above, the relevant statistical and cartographic techniques (ArcGIS) along with Microsoft Excel and STATA 12 have been employed. The analysis and inferences were finally carried out in textual and tabular formats, followed by a description of the study results with suitable diagrams and figures.

5. Results and Discussions

5.1 Distributional Pattern Operational Land Holdings by Size in Karnataka State

A definite standard size of farm most suitable for a definite type of farming cannot be maintained because of the increasing burden and dependency of the agricultural population on arable land and the working of the law of succession in Karnataka state. These result in the splitting of large holdings into small, often widely scattered pieces of land that fail to conform to any reasonable economic standard from the point of view of agricultural operations. To make discussion convenient, land holdings can be grouped into various classes. The all-India Report on Agricultural Census 2015-16 recognised five classes of holdings: marginal (less than an hectare), small (one hectare and above, but below two hectares), semi-medium (2 hectares and above, but less than 4 hectares), medium (4 hectares and above, but less than 10 hectares), and large (10 hectares and above). Class-wise distribution of operational holdings and their total area in Karnataka State is furnished in Table 1 and depicted in Fig. 2.

Source: Agricultural Census Report on Operational Holdings in Karnataka 2015-16 Part-I & Part-II published by DES & Statistics and State Agricultural Census Commissioner, Bengaluru, June and November 2019

Table 1 displays the distributional pattern of the number and area of operational land holdings according to major size classes in Karnataka State in 2015-16. The total number of operational holdings in the state is 86.81 lakhs as per the 2015-16 Agricultural Census, compared to 78.32 lakhs in the previous census, which registered an increase of 10.84 percent. The total area operated under all operational holdings in the current census is found to be 118.05 lakh hectares, a marginal decrease of 2.9 percent compared to 121.62 lakh hectares during the previous census (2010–11). Among the five major size classes of holdings, marginal holdings (less than 1 hectare) account for a maximum share of 54.92 percent of the total number of holdings, followed by small holdings (1 to 2 hectares) at 25.50 percent, semimedium holdings (2 to 4 hectares) at 13.74 percent, medium holdings (4 to 10 hectares) at 5.20 percent, and large holdings (10 hectares and above) at 0.64 percent, being the least. As regards the area operated by different size classes of holdings, semi-medium size class holdings have the highest percentage of area operated, i.e., 27.01 percent, closely followed by the small class with 26.32 percent, the medium size class with 21.76 percent, the marginal size class with 17.62 percent, and the large size class with 7.29 percent, which is the least share.

The entire 86.81 lakh holdings spread across 118.05 lakh hectares of the operated area come under the "wholly owned and self-operated" holdings. Though wholly owned and self-operated holdings of marginal and small farmers (i.e., holdings of 0.01 to 1.99 hectares) account for more than two thirds (80.42%) of the total holdings under all categories, the area operated by them is more than one third (43.94%) of the total area operated (Table 1).

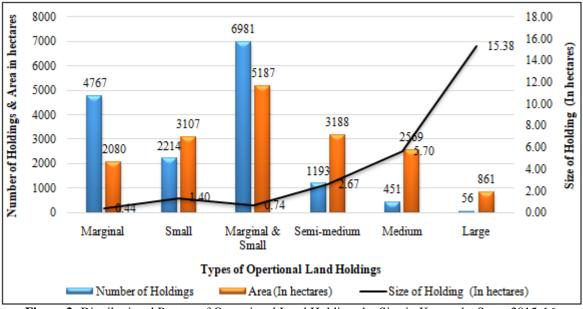

Figure 2: Distributional Pattern of Operational Land Holdings by Size in Karnataka State, 2015-16

The reasons for the increase in the number of operational holdings during the current census, 2015–16, are due to: The impact of the division of larger families into smaller nucleus families leads to the subdivision and fragmentation of agricultural land. During the year 2015-16, the land records across the state were updated for the conduct of the 2016 Agricultural Census. Thus, updating the records showed an increase in the number of operational holdings. Implementation of certain government programmes cleared the small operational holdings of all disputes and debts. Which have contributed to the increase in the number of operational holdings. As the price of precious commercial crops in the international market rose, the barren land was also utilised for cultivation, leading to an increase in the number of operational holdings. Government policy on the lending of loans facilitated the small landholders, particularly SC and ST holders, to regularise the land records, resulting in an increase in the number of operational holdings. Government land was distributed to landless agricultural labourers, particularly among SC and ST holders, which resulted in an increase in the number of operational holdings.

The average size of operational holdings has come down marginally, from 1.55 hectares during the 2010–11 census to 1.36 hectares during the 2015–16 census, by 0.19 hectare, which is mainly due to sub-division and fragmentation of land holdings. This trend is common in every agricultural census. One notable feature is that the average size of holdings increases with an increase in size classes. The marginal size class showed the minimum of 0.44 hectares of average size holdings, followed by small size class holdings of 1.40 hectares, semi-medium size class 2.67 hectares, medium size class 5.69 hectares, and large size class 15.45 hectares, which is observed to be the maximum. The

decrease in average holding size between the two censuses is very insignificant in the case of marginal, small, and semimedium size classes. It has increased in the large size class, and it remains the same in the medium category.

Fig.2 confirms the inequalities in the distribution of area in various size classes in Karnataka State. The average values of Gini's coefficient of concentration ratios turn out to be around 0.5399 and 0.4909 for the years 1970–71 and 2015–16. It has also been confirmed that even in states or nations, there was little change in this pattern. Unfortunately, the consistency in the spatial pattern of distribution established that the processes of diversification in the rural economy and dis-agriculturalization were very weak in the rural side of the study area.

5.2 Spatial Distribution of Size of Holdings:

The impact of the various land reform measures taken over time should be reflected in the pattern of land distribution and can be roughly measured by looking at the concentration of land in various size classes of holdings. In the following paragraphs, an attempt has been made to examine the pattern of land distribution in the state as well as its spatial pattern (district-wise) (Table 2). Among the 30 districts in the state, Belagavi topped the list with 6.20 lakh operational holdings, closely followed by Mandya with 5.62 lakhs, Hassan with 5.39 lakhs, Tumakur with 5.16 lakhs, Mysore with 4.55 lakhs, etc., and Kodagu with 0.68 lakh operational holdings. As regards the area of operational holdings, Belagavi captures first place in the state, indicating 10.10 lakh hectares of area operated, followed by Vijapura with 9.35 lakh hectares, Kalaburgi with 9.12 lakh hectares, Tumakuru with 6.51 lakh hectares, Raichur with 6.16 lakh hectares, etc., and Bengaluru (Urban) with 0.83 lakh hectares.

Source: Agricultural Census Report on Operational Holdings in Karnataka 2015-16 Part-I & Part-II published by DES & Statistics and State Agricultural Census Commissioner, Bengaluru, June and November 2019.

The average size of operational holdings declined in all the districts in the 2015-16 census compared to the 2010-11 census. With regard to the total average size of operational holdings, Vijyapura district ranked first in the state with 2.58 hectares, followed by Kodagu with 2.41 hectares, Gadag with 2.18 hectares, Kalaburgi with 2.16 hectares, etc., and Mandya with 0.57 lakh hectares in 2015-16. To describe the spatial pattern of variations in average size of land holdings in the Karnataka state during 2015-16, all the districts are grouped into four categories, namely, very high, high, medium, and low average size of holdings areas, as represented in Fig. 3. The spatial distribution shows that the very high average size of holdings category of farmers is more than 2.24 hectares only in Kodagu (2.43) and Vijayapur (2.58) districts, and the high average size of holdings is noticed in the ranges from 1.50 to 2.24 hectares only in Haveri (1.61), Belagavi (1.63), Bellary (1.65), Bidar (1.67), Koppal (1.80), Chitradurga (1.83), Yadagir (1.86), Bagalkot (1.88), Raichur (2.06), Dharwad (2.12), Kalburgi (2.16) and Gadag (2.18) districts of the state. The **medium** average size of holdings ranges from 0.75 to 1.49 hectares in Bengaluru (rural) (0.76), Mysore (0.76), Kolar (0.77), Bengaluru (urban) (0.78), and Dakshina Kannada (0.81). Chikkaballapur (0.83). Hassan (0.83), Chamarajnagar (0.94), Shivamogga (1.11), Tumakuru (1.26), Chikkamagalur (1.36), and Davanagere (1.37) districts of the state While Mandya (0.57), Ramanagar (0.68), Udupi (0.70), and Uttara Kannada (0.74) districts of the state registered in **low** (less than 0.74 hectare) average holdings zones.

Source: Agricultural Census Report on Operational Holdings in Karnataka 2015-16 Part-I & Part-II published by DES & Statistics and State Agricultural Census Commissioner, Bengaluru, June and November 2019

The spatial pattern of changes in average size of land holdings during 2015-16 over in 2010-11 in the Karnataka state displays varies from a least of-0.09 hectares in Davanageredistrict to a highest of -0.37 hectares in Tumakuru district of the state (Table-3 and Fig.4). To describe of the spatial distribution, it has grouped conveniently into four categories and it shows that, very high zone noticed (more than -0.30 ha) in Bellary (-0.30) and Tumakuru (-0.37) districts, high (-0.20 to -0.29) in Dharwad (-0.28), Bagalkot (-0.26), Belagavi (-0.24)Hassan (-0.23), Chikkaballapur (-0.23), Kolar (-0.22), Mandya (-0.23)

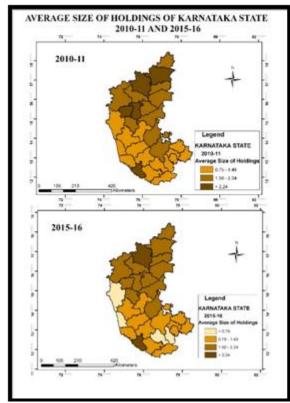

0.21), Kalburgi (-0.21), Vijayapur (-0.20), Bengaluru (Urban) (-0.20) and Gadag (-0.20) districts, medium (-0.10 to -0.19) only in Mysore (-0.19), Koppal (-0.19), Bidar (-0.13), Haveri (-0.12), Shivamogga (-0.11), Chitradurga (-0.10) and Yadagir (-0.10) districts, while ten districts of the state namely Davanagere (-0.09), Bengaluru (Rural) (-0.09), Chamarajnagar (-0.07), Ramanagar (-0.06), Udupi(-0.05), Chikkamagalur (-0.04), Uttara Kannada (-0.04), Dakshina Kannada (-0.04), Raichur (-0.04) and Kodagu (-0.01) observed in low (Less than -0.09) zone of the Karnataka state (Fig-4).

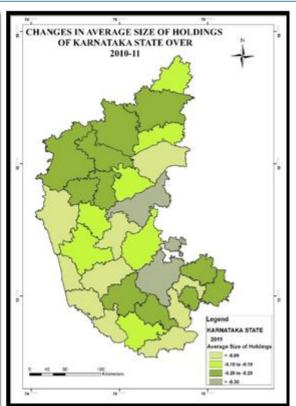

Figure 4: Changes in Average Size of Land Holdings in Karnataka State over 2010-11

5.3 Changes in Size-Distribution of Holdings:

To have a factual knowledge of the process of sub-division of holdings, information pertaining to them at ten censuses of the Karnataka state has been presented in Tables 4 to 5 and Fig. 4. It is very clear from the tables and figures that the number and area of operational holdings falling in the marginal, small, and semi-medium classes have been increasing at the expense of medium and large holdings. But the average size of respective groups has been decreasing in the state during the study period. Thus, under optimal holdings, holdings are multiplying, which still degrades the situation. During the first Agricultural Census 1970–71, the

number of operational holdings in Karnataka state, which was 35.51 lakh, increased by over 144.47 percent compared to the tenth Agricultural Census 2015–16 figures of 86.81 lakh holdings (Table 4 and Fig. 5).

Among the five major size classes of holdings, marginal holdings (less than one hectare) account for a maximum share of 54.92 percent of the total number of holdings, followed by small holdings (one to two hectares) at 25.50 percent, semi-medium holdings (two to four hectares) at 13.74 percent, medium holdings (four to ten hectares) at 5.20 percent, and large holdings (more than ten hectares and above) at 0.64 percent, being the least in 2015-16.

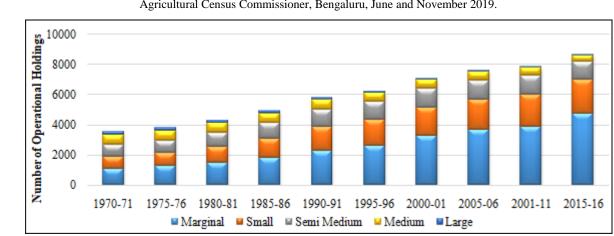

Figure 5: Trends in Number of Operational Holdings according to Major Size Classes in Karnataka State:1970-71 to 2015-

Regarding the area operated, during the first census of 1970–71, it was 113.68 lakh hectares and increased to 118.05 lakh hectares during the 2015–16 census, with an increase of about 3.84 percent (Table.5 and Fig.6). The trend in the area operated during the first agriculture census in 1970–71 shows a slight decrease of 0.10 percent compared to the 1976–77 census. An increasing trend was observed during the subsequent three censuses (1980–81, 1985–86, and 1990–91), and once again in the 1995–96 census, it fell marginally by 1.72 percent and then increased by 1.64 and 0.63 percent during the 2000–01 and 2005–06 censuses, respectively, and it marginally fell by 1.80 and 2.94 percent during 2010–11 and 2015–16, respectively.

The number of marginal size class holdings has increased from 10.81 lakhs in the 1970–71 census to 47.67 lakhs in the 2015–16 census by around 71.85 percent, and the area of operational holdings has also increased from 5.49 lakh hectares in 1970–71 to 20.80 lakh hectares in 2015–16 by

350.34 percent. In the case of the large-size class holdings, both the number and area of operational holdings have considerably decreased. The number of operational holdings has come down from 2.19 lakhs in the 1970-71 census to 0.56 lakhs in 2015-16 by 3.18 percent. Similarly, the area has decreased from 36.01 lakh hectares to 8.61 lakh hectares by 627.00 percent compared to the current and previous censuses. However, in respect of small size classes, the number and area of operational holdings have shown an increasing trend compared to the previous census, i.e., the number and area of operational holdings have increased by 26.78 and 431.58 percent, respectively. Under the semimedium size class, the number and area of operational holdings have shown an increase of 7.89 and 224.94 percent, respectively. Similarly, in the case of medium-sized class holdings, the number and area of operational holdings decreased by 3.35 percent and 279.86 percent, respectively, between the 1970-71 and 2015-16 censuses.

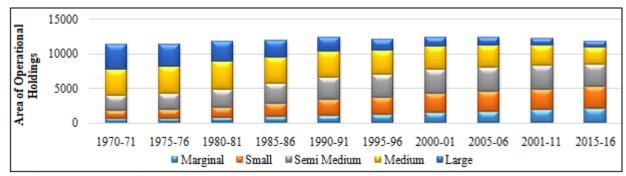

Figure 6: Trends in Area of Operational Holdings according to Major Size Classes in Karnataka State:1970-71 to 2015-16

The trend of the average size of operational holdings was gradually decreasing at every census period. It may be noted that the average size of operational holdings, which was 3.20 hectares in the first Agricultural Census of 1970–71, has decreased to 1.36 hectares during the 2015–16 census, indicating a shortfall of 57.52 percent, which is mainly due to sub-division and fragmentation of land holdings. This trend is common in every Agricultural Census (Table 6 and Fig. 7). One notable feature is that the average size of holdings increases with an increase in size classes. The

marginal size class showed the minimum of 0.44 hectares of average size holdings, followed by small size class holdings of 1.40 hectares, semi-medium size class 2.67 hectares, medium size class 5.69 hectares, and large size class 15.45 hectares, which is observed to be the maximum. The decrease in average holding size between the two censuses is very insignificant in the case of marginal (-0.07 ha), small (-0.05 ha), and semi-medium (-0.13 ha) size classes. It has further decreased in the large size class (-1.07 ha), and it remains the same in the medium category (-0.39 ha).

6. Policies & Programmes

The multi-pronged strategy for agricultural development now comprises focusing on agricultural growth through sustainable use of natural resources such as land and water while at the same time taking steps to improve the socioeconomic conditions of agriculturalists. Innovative approaches are being adopted for better management of the farming sector. Importance is being placed on improved institutions and organisations so that farmers' welfare is built into the system. Several steps are being taken to strengthen diverse aspects of the agricultural system, mainly through land reforms. Some of the prime initiatives introduced by the government of India have been listed below.

The National Policy for Farmers 2007 (NPF 2007), formulated by the Ministry of Agriculture and Farmers Welfare, recommended that "prime farmland must be conserved for agriculture except under exceptional circumstances, provided that the agencies that are provided with agricultural land for non-agricultural projects should compensate for treatment and full development of equivalent degraded or wastelands elsewhere. For non-agricultural purposes, as far as possible, land with low biological potential for farming would be earmarked and allocated". State governments have been advised to "earmark lands with low biological potential, such as uncultivable land, land affected by salinity, acidity, etc., for non-agricultural development activities, including industrial and construction activities".

Similarly, the National Rehabilitation and Resettlement Policy, 2007 (NRRP), formulated by the Department of Land Resources, Ministry of Rural Development, recommends that only the minimum area of land commensurate with the purpose of a project may be acquired. Also, as far as possible, industrial projects may be set up on wasteland, degraded land, or unirrigated land. Acquisition of agricultural land for non-agricultural use in the project may be kept to the minimum; multi-cropped land may be avoided to the extent possible for such purposes; and acquisition of irrigated land, if unavoidable, may be kept to the minimum.

In addition, the **Right to Compensation**, **Transparency in Land Acquisition**, **Rehabilitation**, **and Resettlement** Act encompasses proper rehabilitation and resettlement, fair compensation, and some degree of restriction in the diversion of agricultural land.

1) Way Forward for Policy Implications:

The present study has suggested the following possible policy initiatives that could be considered for the better management of land resources in the river basin: The findings could be utilised for evolving long-term measures for sustainable land use by planners, policymakers, and other agencies and institutions. Agriculture, being one of the most important sectors, necessitates an appropriate policy vision to redeem the agricultural sector from stagnation and instability and put it on the stream of sustainable growth on the one hand and to assert the ongoing tendency of the large-scale commercialization of agriculture on the other. The implications of the study are briefly presented below.

- Land Use: Policy For proper management of natural resources and to ensure sustainable agricultural growth in the country, there is a need for a clear land use policy. As per the Seventh Schedule of the Constitution of India, land and water fall under the purview of state governments, and it is for states to bring about suitable legislation for regulating the conversion of agricultural land into non-agricultural purposes. Land use planning should be integrated with all developmental programmes, especially the MNREGA, for holistic rural development, natural resource management, and eco-restoration.
- Land Reform: Considering the skewed ownership pattern
 of land, it is necessary to strengthen the implementation
 of laws relating to land reforms, with particular reference
 to tenancy laws, leasing, facilitation of contract farming,
 distribution of ceiling-surplus land and wasteland,
 providing adequate access to common property and
 wasteland resources, and consolidation of holdings.
- Control on Fragmentation of Land: Land fragmentation leads to a reduction in landholding size and makes it uneconomical for optimal farm operations, the application of science and technology, and mechanisation. Besides, fragmentation necessitates too many field boundaries and bunds and leads to the wastage of land. Therefore, laws ensuring reforms in land tenancy rules and automatic land rights inheritance need to be legislated to encourage sharecropping and

ISSN: 2319-7064 SJIF (2022): 7.942

contract farming and to render physical boundaries and fencing irrelevant.

- Revisiting various succession acts: Multiple succession acts need to be revised, and a common succession act needs to be put in place for smooth inheritance. It is necessary to ensure that land rights go to the inheritors, but land fragmentation is avoided.
- Control on Fragmentation of Land: Land fragmentation leads to a reduction in landholding size and makes it uneconomical for optimal farm operations, the application of science and technology, and mechanisation. Besides, fragmentation necessitates too many field boundaries and bunds and leads to the wastage of land. Therefore, laws ensuring reforms in land tenancy rules and automatic land rights inheritance need to be legislated to encourage sharecropping and contract farming and to render physical boundaries and fencing irrelevant.
- Policy on Diversion of Land and Land Tenancy: Productive agricultural land should not be diverted to industrial or urbanisation activities. In cases of extreme national need, it should be stipulated that industries provided with agricultural or other land for development projects compensate for the treatment and full development of the equivalent degraded land or wasteland elsewhere. Each state should promulgate land tenancy legislation or policy so that tenants instead of landowners can benefit from the various subsidy and crop insurance programmes and, therefore, tenant land is put to crop production.

7. Conclusions

Land and water are the two most important natural resources for the development of agriculture. The success of agriculture mainly depends on the proper and scientific utilisation of these resources. The present paper has analysed the trend and inequality analysis of the size of operational holdings in Karnataka state across ten census periods (i.e., from 1970-71 to 2015-16). The entire 86.81 lakh holdings spread across 118.05 lakh hectares of the operated area come under the "wholly owned and self-operated" holdings. Though wholly owned and self-operated holdings of marginal and small farmers (i.e., holdings of 0.01 to 1.99 hectares) account for more than two thirds (80.42%) of the total holdings under all categories, the area operated by them is more than one third (43.94%) of the total area operated in 2015-16. During the first Agricultural Census 1970-71, the number of operational holdings in Karnataka state, which was 35.51 lakh, increased by over 144.47 percent compared to the tenth Agricultural Census 2015-16 figures of 86.81 lakh holdings. Regarding the area operated, during the first census of 1970-71, it was 113.68 lakh hectares and increased to 118.05 lakh hectares during the 2015–16 census, with an increase of about 3.84 percent. For the state as a whole, the Gini-coefficient of concentration degree of inequality in the distribution of operated land has declined from 0.5399 percent in 1970-71 to 0.4909 percent in 2015-

The trend of the average size of operational holdings was gradually decreasing at every census period. It may be noted that the average size of operational holdings, which was 3.20 hectares in the first Agricultural Census of 1970–71, has

decreased to 1.36 hectares during the 2015–16 census, indicating a shortfall of 57.52 percent, which is mainly due to sub-division and fragmentation of land holdings. The variations in number and area of operational holdings falling into marginal, small, and semi-medium classes have been increasing at the expense of medium and large holdings. But the average size of respective groups has been decreasing in the state during the study period, i.e., from 1970–71 to 2015–16. Thus, under optimal holdings, holdings are multiplying, which still degrades the situation.
