Abstract: Chlorophyll is a green pigment, which is structurally similar to porphyrin pigments such as heme and it is produced through the same metabolic pathway. Chlorophyll benefits the body in a unique and distinctive ways. It is helps to cleanse harmful toxins from the body and it is also uses to fight infection. A recommended and regular intake of chlorophyll can keep the circulatory and digestive systems much healthier. In the present study, the chlorophyll was extracted from the leaves from nine medicinal plants and characterized by UV-Visible spectroscopy. Concentration of chlorophyll a and b was calculated using Arnon method. Chlorophyll content was higher in Mimosa pudica than other medicinal plants which are used in this study.

Keywords: Chlorophyll a, chlorophyll b, Medicinal plants, UV- Visible spectroscopy, Mimosa pudica.

1. Introduction

Chlorophyll is a green pigment consists of tetrapyrrole ring with a central magnesium ion. It has a long hydrophobic phytol chain in its structure. It is found in some varieties in plants and algae (Aminot, 2000). Two types of chlorophyll, a and b are present in green algae and terrestrial plants. The difference between these two chlorophylls is a methyl moiety in chlorophyll a replaced by a formyl group in chlorophyll b. The ratio of chlorophyll a to chlorophyll b in higher plants is approximately 3:1. Chlorophyll absorbs light mainly in the red (650 – 700 nm) and the blue - violet (400 – 500 nm) regions of the visible spectrum. Green light (~550 nm) is not absorbed but reflected giving chlorophyll its characteristic color. Chlorophyll a possesses a green-blue color, and chlorophyll b possesses a green-yellow color (Arnon, 1849).

In tumor or cancer therapy chlorophyll or chlorophyll derivatives can be utilized as a photodynamic agent. (Brandis et al., 2006). It can be studied, modified and synthesized in chemistry and physics disciplines for different applications, that is electronic, photophysics, optoelectronic, electrochemistry (Nurhayati and Veinardi Suendo, 2011). Chlorophyll fluorescence parameters and evaluation of chlorophyll content and relationships between chlorophyll a and b were determined in Dezful olive trees (khaleghi,et al, 2012). José Francisco (2008) estimated the chlorophyll concentration in leaves of tropical wood species from Amazonian forest using portable chlorophyll meter. Non-destructive optical methods have been developed for estimation and measurement of chlorophyll concentrations in leaves. It express relative values of chlorophyll rather than absolute values per or leaf mass unit of area, but the concentration of chlorophyll present in the leaves are proportional to the values obtained through this methods with portable chlorophyll meters. (Richardson et al. 2002).

2. Materials and Methods

Collection of plants
The medicinal plants include Melothira maderaspatalana (mumusukkai keerai) Clitoria ternatea (Sagupushpam) Boerhavia diffusa (Mukkarattai keerai) Pongamia pinata(L.) Pierre (Punga maram) Aegle marmelos.(L.) correa (Vilvam) Phyllathus fraternus (Kizaneli) Mimosa pudica (Touch me not) Pisonia grandis (Lecchayi Kottai keerai) Acalypha indica (Kupameni) was collected from MSME, herbal garden in Guindy, Chennai, India.

Extraction of chlorophyll (Arnon, 1949)
One gram of finely cut fresh leaves were taken and ground with 20 – 40ml of 80% acetone. It was then centrifuged at 5000 – 10000rpm for 5mins. The supernatant was transferred and the procedure was repeated till the residue becomes colorless. The absorbance of the solution was red at 645nm and 663nm against the solvent (acetone) blank.

Estimation of Chlorophyll content
The concentrations of chlorophyll a, chlorophyll b and total chlorophyll were calculated using the following equation: Total Chlorophyll: 20.2(A645) + 8.02(A663)
Chlorophyll a: 12.7(A663) – 2.69(A645)
Chlorophyll b: 22.9(A645) – 4.68(A663)

3. Results and Discussion

Greens are important sources of protective food which are highly beneficial for the maintenance of good health and prevention of diseases. In this study commonly available plant leaves were used to estimate the chlorophyll content. A total of ten plants were selected for this study these include

Figure 1: Concentration of chlorophyll a.

Figure 2: Concentration of chlorophyll b.
Chlorophyll estimation was done in the fresh green leaf samples extracted with the acetone solvent. The absorbancy readings of chlorophyll extracts were measured in two different wavelengths 645nm and 663nm respectively. Based on the absorbancy value calculations were made using Arnon’s (1949) equation and the amount of chlorophyll a, chlorophyll b and total chlorophyll were estimated and tabulated. The highest total chlorophyll content \((a + b)\) was detected in *Mimosa pudica* (82.6 \(\mu g/ml\)), followed by *Pongamia pinnata* (L.) Pierre (71.1\(\mu g/ml\)) and *Acalypha indica* (69.91 \(\mu g/ml\)). Khaleghi (2012) showed that the amount of leaf chlorophyll a and total chlorophyll (chl a+b) were reduced by increasing water deficit and the amount of total chlorophyll and chlorophyll a were higher in plants. José Francisco et al., (2008) determined Chlorophyll Concentrations in tropical tree species by portable Chlorophyll meter with appropriate adjustment equations. Faisal and Anis et al., 2006 reported higher amount of chlorophyll a (0.91 ± 0.19 mg/g FW) and chlorophyll b (0.61 ± 0.09 mg/g FW) in micro propagated plants of *Psoralea corylifolia* compared to chlorophyll a (0.83 ± 0.31 mg/g FW) and chlorophyll b (0.53 ± 0.14 mg/g FW) in seedlings. Sukran Dere (1998) was found that the level of chlorophyll a in fresh water form cladophora glomerata was rather high in comparison with *Ulva rigita* L., *Codium tomentosum* and *Cladostephus verticillatus* Ag. The chlorophyll a level was also found higher in *Ulva rigita*. In earlier studies, it was suggested that in all algae groups almost the chlorophyll a relating to the pigment level was same. The amount of chlorophyll a and chlorophyll b in normal leaf was less when compared to the regenerated leaf.

José Francisco et al., (2008) determined Chlorophyll Concentrations in tropical tree species by portable Chlorophyll meter with appropriate adjustment equations. Portable Chlorophyll meter provides convenient and non-destructive way to estimate the Chlorophyll concentrations. Faisal and Anis et al., 2006 reported higher amount of chlorophyll a (0.91 ± 0.19 mg/g FW) and chlorophyll b (0.61 ± 0.09 mg/g FW) in micro propagated plants of *Psoralea corylifolia* compared to chlorophyll a (0.83 ± 0.31 mg/g FW) and chlorophyll b (0.53 ± 0.14 mg/g FW) in seedlings. Sukran Dere (1998) was found that the level of chlorophyll a in fresh water form cladophora glomerata was rather high in comparison with *Ulva rigita* L., *Codium tomentosum* and *Cladostephus verticillatus* Ag. The chlorophyll a level was also found higher in *Ulva rigita*. In earlier studies, it was suggested that in all algae groups almost the chlorophyll a relating to the pigment level was same. The amount of chlorophyll a and chlorophyll b in normal leaf was less when compared to the regenerated leaf. Indira Priyadarsini *et al.*, 2015 estimated the chlorophyll content of *Tridax procumbens* grown in normal and polluted region and reported that the chlorophyll content in normal and polluted regions is 2.99mg/g and 2.56 mg/g respectively.

### 4. Conclusion

Chlorophyll from *Melothira maderaspatana* (mumusukkai keerai) *Clitoria ternatea* (Sagupushpam) *Boerhavia diffusa* (Mukkarattai keerai) *Pongamia pinnata* (L.) Pierre (Punga maram) *Aegle marmelos* (L.) corre (Vilvam) *Phyllanthus fraternus* (Kizanelli) *Mimosa pudica* (Touch me not) *Pisonia grandis* (Lecchai Kottai keerai) *Acalypha indica* (Kupameni) was extracted and estimated. Considering the results obtained in this work, among these nine medicinal plants chlorophyll content in *Mimosa pudica* leaves was higher followed by *Pongamia pinnata* (L.) pierre (71.1\(\mu g/ml\)) *Acalypha indica* (69.91 \(\mu g/ml\)). The concentration of chlorophyll may vary in different region.
